# NC7SZ175

## TinyLogic UHS D-Type Flip-Flop with Asynchronous Clear

## Description

The NC7SZ175 is a single positive edge-triggered D-type CMOS Flip-Flop with Asynchronous Clear from ON Semiconductor's Ultra High Speed Series of TinyLogic in the space saving SC70 6-lead package. The device is fabricated with advanced CMOS technology to achieve ultra high speed with high output drive while maintaining low static power dissipation over a very broad V<sub>CC</sub> operating range. The device is specified to operate over the 1.65 V to 5.5 V V<sub>CC</sub> range. The inputs and output are high impedance when V<sub>CC</sub> is 0 V. Inputs tolerate voltages up to 5.5 V independent of V<sub>CC</sub> operating voltage. This single flip-flop will store the state of the D input that meets the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. A LOW input to Clear sets the Q output to LOW level. The Clear input is independent of clock.

## Features

- Space Saving SC70 6-Lead Package
- Ultra Small MicroPak<sup>TM</sup> Leadless Package
- Ultra High Speed:  $t_{PD}$  2.6 ns Typ into 50 pF at 5 V V<sub>CC</sub>
- High Output Drive: ±24 mA at 3 V V<sub>CC</sub>
- Broad V<sub>CC</sub> Operating Range: 1.65 V to 5.5 V
- Matches the Performance of LCX when Operated at 3.3 V  $V_{CC}$
- Power Down High Impedance Inputs / Output
- Overvoltage Tolerant Inputs Facilitate 5 V to 3 V Translation
- Proprietary Noise / EMI Reduction Circuitry Implemented
- These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

## ORDERING INFORMATION

See detailed ordering, marking and shipping information in the package dimensions section on page 6 of this data sheet.

## **Connection Diagrams**

Figure 2. SC70 (Top View)

AAA represents Product Code Top Mark – see ordering code.

NOTE: Orientation of Top Mark determines Pin One location. Read the Top Product Code Mark left to right, Pin One is the lower left pin (see diagram).

## NC7SZ175

#### CAPACITANCE (T<sub>A</sub> = +25°C, f = 1 MHz)

| Symbol           | Parameter                              | Condition  | Тур      | Max | Units |
|------------------|--|--|----------|-----|-------|
| C <sub>IN</sub>  | Input Capacitance                      | $V_{CC}$ = Open, $V_{IN}$ = 0 V or $V_{CC}$        | 3        | _   | pF    |
| C <sub>OUT</sub> | Output Capacitance                     | $V_{CC}$ = 3.3 V, $V_{IN}$ = 0 V or $V_{CC}$       | 4        | -   | pF    |
| C <sub>PD</sub>  | Power Dissipation Capacitance (Note 2) | V <sub>CC</sub> = 3.3 V<br>V <sub>CC</sub> = 5.0 V | 10<br>12 |     | pF    |

C<sub>PD</sub> is defined as the value of the internal equivalent capacitance which is derived from dynamic operating current consumption (I<sub>CCD</sub>) at no output loading and operating at 50% duty cycle. (See Figure 6)

 $C_{PD}$  is related to  $I_{CCD}$  dynamic operating current by the expression:  $I_{CCD} = (C_{PD}) (V_{CC}) (f_{IN}) + (I_{CC} static)$ .

#### AC Loading and Waveforms

 $C_L$  includes load and stray capacitance Input PRR = 1.0 MHz,  $t_W$  = 500 ns.
